```
The present sequence represents a synthetic oligonucleotide HBV46MYb which is complementary to a portion of the hepatitis B virus (HBV) RNA. The antisense oligonucleotide may be used to detect the presence of HBV in a sample. The antisense oligonucleotide, and oligonucleotides containing a sequence which is complementary to at least two noncontaining a regions of an HBV nucleic acid, may be used for inhibiting HBV replication in a cell or for the treatment of HBV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Oligo:nucleotide(s) complementary to hepatitis B virus (HBV) sequences used in the detection and treatment of HBV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Kilkuskie RE, Mills JS;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a synthetic oligonucleotide HBV46Yb which is complementary to a portion of the hepatitis B virus (HBV) RNA. The antisense oligonucleotide may be used to detect the presence of HBV in a sample. The antisense oligonucleotide, and oligonucleotides containing a sequence which is complementary to at least two non-contiguous regions of an HBV nucleic acid, may be used for inhibiting HBV replication in a cell or for the treatment of HBV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Oligo:nucleotide(s) complementary to hepatitis B virus (HBV) sequences used in the detection and treatment of HBV infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a synthetic oligonucleotide HBV88b which is complementary to a portion of the hepatitis B virus (HBV) RNA. The antisense oligonucleotide may be used to detect the presence of HBV in a sample. The antisense oligonucleotide, and oligonucleotides containing a sequence which is complementary to at least two non-contiguous regions of an HBV nucleic acid, may be used for inhibiting HBV replication in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Oligo:nucleotide(s) complementary to hepatitis B virus (HBV) sequences used in the detection and treatment of HBV infection.

```
contains a sequence which is complementary to at least two non-contiguous regions of a hepatitis B virus (HBV) nucleic acid. The antisense oligonucleotide may be used to detect the presence of HBV in a sample. The antisense oligonucleotide, and oligonucleotides complementary to a portion of the HBV RNA, may be used for inhibiting HBV replication in a cell or for the treatment of HBV infection
                                                                                                                                                                                        The present sequence represents a synthetic oligonucleotide HBV-89b which
                                                                                   o:nucleotide(s) complementary to hepatitis B virus (HBV) sequences in the detection and treatment of HBV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents a synthetic oligonucleotide HBV88Mb which is complementary to a portion of the hepatitis B virus (HBV) RMs. The antisense oligonucleotide may be used to detect the presence of HBV in a sample. The antisense oligonucleotide, and oligonucleotides containing a sample. The antisense oligonucleotide, and oligonucleotides containing a sequence which is complementary to at least two non-contiguous regions of an HBV nucleic acid, may be used for inhibiting HBV replication in a cell or for the treatment of HBV infection
                                                                                                                                                                                                                                                                                                                                                                      Oligo:nucleotide(s) complementary to hepatitis B virus (HBV) sequences used in the detection and treatment of HBV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /*tag= a

The present invention describes a method of screening for an antiviral agent by the protein-priming activity of hepatitis B virus (HBV) DNA polymerase. Also described is developing an antiviral agent with a high selectivity to HBV which can be used for high-throughput screening. The present sequence represents an RNA oligonucleotide which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Screening of antiviral agents by protein-priming activity of hepatitis virus DNA polymerase.
                                                                                                                                                                                                                                                                                                                                                                                          screening; antiviral; hepatitis B virus; HBV; DNA polymerase;
                                                                                                                                                                                                                                                                                                                                                          Hepatitis B virus DNA polymerase related RNA oligonucleotide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a synthetic oligonucleotide HBV-89Mb which contains a sequence which is complementary to at least two noncontiguous regions of a hepatitis B virus (HBV) nucleic acid. The antisense oligonucleotide may be used to detect the presence of HBV in a sample. The antisense oligonucleotide, and oligonucleotides complementary to a portion of the HBV RNA, may be used for inhibiting HBV replication

The present invention relates to hepatitis B virus (HBV) strain FR1, genotype G DNA encoding PreCore/Core protein, HBpol, envelope (PreS1, PreS2 and surface antigen HBsAg) and HBx proteins. HB yenotype G nucleic acids and surface antigen HBsAg) and HBx proteins. HBV genotype G nucleic acids and polypeptides are useful for diagnosing, prognosing and treating infections caused by HBV genotype G. They can be used in a vaccine to treat or prevent HBV genotype G infection. The HBV genotype G darived nucleic acids and antibodies are useful for detecting HBV genotype G in a sample or diagnosis of HBV genotype G infection. The presence of HBV genotype G statistically correlates with the presence of luver damage and/or liver cancer in the subject. The HBV genotype G core insert to study and predict the evolution of anti-HBC and anti-HBC antibodies and HBAQ (genotype G antigen) in patients infected with HBV. The antibodies or antigens of HBV genotype G are useful for identifying a stage of liver disease caused by HBV genotype G DNA fragment encoding e antigen (HBCAG)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel hepatitis B virus genotype G, nucleic acids encoding virus, polypeptides encoded by nucleic acids, useful for preparing vaccine to treat or prevent the hepatitis B virus genotype G infection in a subject.

The present invention relates to hepatitis B virus (HBV) strain FRI, genotype G DNA encoding PreCore/Core protein, HBpol, envelope (PreSI, PreS2 and surface antigen HBsAg) and HBX proteins. HB yearouype G nucleic acids and polypeptides are useful for diagnosing, prognosing and treating infections caused by HBV genotype G. They can be used in a vaccine to treat or prevent HBV genotype G infection. The HBV genotype G derived nucleic acids and antibodies are useful for detecting HBV genotype G in a sample or diagnosis of HBV genotype G infection. The presence of HBV genotype G infection in the presence of liver damage and/or liver cancer in the subject. The HBV genotype G core insert peptide encoding nucleic acid is useful for designing monitoring assays to study and predict the evolution of anti-HBe and anti-HBC antibodies and HBAGA (genotype G antigen) in patients infected with HBV. The antibodies or antigens of HBV genotype G are useful for identifying a stage of liver disease caused by HBV genotype G DNA fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Hepatitis B virus; HBV; core antigen; HBcAg; immune system; typhoid; prophylacito; gene therapy; vaccine; hepatitis A virus; HAV; herpes; hepatitis A virus; HAV; herpes; tubertis C virus; HCV; influenza; foot-and-mouth disease; diarrhoea; tuberculosis; polio; rables; acquired immunodeficiency syndrome; AIDS; dengue fever; pallow fever; malaria; whooping cough; salmonellosis; food poisoning; meningitis; gonorrhea; antiviral; antibacterial; antiprotozoal; ds.

The present invention relates to hepatitis B virus (HBV) core antigen (HBCAG) fusion proteins and polymucleotides encoding such proteins. Sequences of the invention are useful in methods of prophylactic or therapeutic vaccination or to manufacture medicaments for prophylactic or therapeutic vaccination of the human or animal body against HBV, e.g. against viral hepatitis. They are also useful as a prophylactic vaccine against e.g. hepatitis c virus, influenza, polio, herpes, rabies, acquired immune deficiency syndrome (AIDS) or foot-and-mouth disease. The present sequence is a DNA encoding hepatitis B virus core antigen (HBCAG)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Hepatitis B (HB) core antigen fusion proteins, useful as vaccines for the prophylactic or therapeutic treatment of humans or animals against e.g. HB virus, viral hepatitis, hepatitis C virus, influenza, or foot-and-mouth disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Hepatitis B virus; HBV; preCore; Core; preS1; preS2; HBS; HBV01; HBBAQ1; antiviral; vaccine; genotype G; genotype A; genotyping; HBCAG1; HBAAG; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to modified proteins comprising hepatitis B virus (HBV) core antigen (HBCAG) wherein one or more of the four arginine repeats has been deleted and the protein comprising the C-terminal cysteine of HBCAG. The deleted region may be replaced by an epitope from a protein other than HBCAG, in which case the HBCAG acts as a carrier to present the epitope to the immune system. This chimeric protein or its nucleic acid is useful as a vaccine or in a method of prophylactic or therapeutic vaccination of the human or animal body, particularly against HBV. The nucleic acid encoding the protein may be used in gene therapy or DNA vaccination protocols. The chimeric protein or its nucleic acid may also be used as the basis of a prophylactic vaccine against a range of diseases, e.g. HBV, hepatitis A virus (HAV), hepatitis C virus (HCV), influenza, foot-and-mouth disease, pollo, herpes, rabies, acquired immunodeficiency syndrome (ADS), dengue fever, yellow fever malaria, diarrhoea, meningitis or gonorrhea. The present sequence is a DNA encoding Hepatitis B virus core antigen (HBCAG)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                      New proteins comprising a modified hepatitis B core antigen, useful as a vaccine in prophylactic or therapeutic vaccination of the human or animal body, particularly against hepatitis B virus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Hepatitis B virus core antigen; HBcAg; prophylactic; viral hepatitis; therapeutic; vaccine; acquired immune deficiency syndrome; influenza; polio; herpes; rabies; AIDS; foot-and-mouth disease; ds.

```
human hepatitis B virus (HBV) genotype, provisionally named genotype G.
This genotype was found with a high prevalence in patients chronically
infected with HBV and residing in Europe and the USA. The invention
relates to a fully defined sequence of 3248 nucleotides as given in
sequence that is degenerate to the mentioned sequence, or
sequence that is degenerate to the mentioned sequences. These
colorable is degenerate to the mentioned sequence in a biological
sequence that is degenerate to the mentioned sequence with sequence, or
colorable is degenerate to the mentioned sequence of
colorable is degenerate to the proteins and proteins encoded by
the polynucleotides are useful for detecting antibodies in a biological
sample. Ligands that bind to the proteins and antibodies directed against
the proteins are useful for detecting the proteins and for detecting
the proteins are useful for detecting the proteins and for detecting
the proteins are useful for detecting the proteins and so useful for
consistent and HBEAAG (precore precursor proteins). They are also useful for
present sequence is provided in an alignment of preCore/Core sequences of
an HBV genotype A strain (HBVXCPS) and 7 strains (FRI, FRZ, USI, US3,
colorable in the protein and the p

Novel isolated and/or purified hepatitis B virus polypeptide and polynucleotide sequences that are phylogenetically different from HBV genotype A-F molecules, useful for HBV diagnosis, prophylaxis and therapy

Claim 3; Fig 7; 94pp; English.

The invention relates to the complete nucleic acid sequence of a new human hepatitis B virus (HBV) genotype, provisionally named genotype G. This genotype was found with a high prevalence in patients chronically infected with HBV and residing in Europe and the USA. The invention

specification, as sequence with 92% identity to the given sequence, or sequence that is degenerate to the mentioned sequences. These polynucleotides are useful for the genetyping. The proteins encoded by the polynucleotides are useful for detecting antibodies in a biological sample. Ligands that bind to the proteins and antibodies directed against the proteins are useful for detecting the proteins and for detecting HBCAG and HBCAG precents proteins. They are also useful for preparing a vaccine or medicament for treating HBV infections. The an HBV genotype A strain (HBVACPS) and 7 strains (FRI, FR2, USI, US3, US1, US3, US1, US3, US1, US3, relates to a fully defined sequence of 3248 nucleotides as given in 8866666666668888

This sequence has been recovered from the left border of the T-DNA.

It indicates an insertion within the locus defined by BAC clone

13423. Details on the protocols used for generation of the sequence

are described in References 1-3. The sequences are generated at the

MPI for Plant Breeding Research in the context of the GABI-Kat

project. GABI-Kat is part of the German Plant Genomics program

designated (GABI'. Information on line availability can be found

at: http://www.mpiz-koeln.mgs.de/GABI-Kat/.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Rosso, M.G., Li, Y., Strizhov, N., Reiss, B., Dekker, K. and Weisshaar, B.
An Arabidopsis thaliana T-DNA mutagenized population (GABI-Kat) for flanking sequence tag-based reverse genetics
Plant Mol. Biol. 53 (1-2), 247-259 (2003)

The lines contain one or more T-DNA insertions. The DNA fragment(s) resulting from the PCR were directly sequenced to determine the genomic sequence flanking the insertion. T-DNA derived sequences were removed.

Juckes 1. Sall; Juckes 2. Not1; Mouse cDNA project by the Laboratory of Genetices. Not1; Mouse cDNA project by the Laboratory of Genetices. National Institute on Aging (NIA), Intramural Research Program, NIH (http://lgsun.grc.nia.nih.gov/cDNA). This is a long-transcript enriched cDNA library (Ref. Genome Res. 11: 153-1558 (2001). [PMID: 11544199]). Total RNAS were obtained from Dr. Akihiro Umczawa (Keio University School of Medicine, Japan). Double stranded CDNAS were synthesized with an Oligo (dT) primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

The sequences are based on single pass reads.
Life Technologies (a division of Invitrogen) members carried out
full-length librairies construction: Temple G.
Genoscope members carried out sequencing and annotation: Castelli
V., Aury J.M., Jaillon O., Wincker P., Menard M., Cruaud C.,
Schachter V., Weissenbach J., Salanoubat M.
URGV IRRA: Clepet C., Caboche M.
Annotation is based on the June 2003 version of the Arabidopsis
genome released by MIPS (Munich Information center for Protein
Sequences).

(http://www.iax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with 74 DNA polymerase and 74 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gol electrophoreais. Vector DNA was prepared from a derivative of pWD42 (gi|473214|qb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into

2.2 ug of total RNA, treated with T4 DNA polymerse, and purified by ethanol-precipitation. The CDNAs were ligated to Lone-linker LL-Sal4, purified by phenol/Chloroform, and separated from free linkers by Centricon 100. Then, the CDNAs were amplified by long-range high fidelity PCR using Ex Taq polymerase (Takara) with a primer Sal4-S. The products were purified by phenol/Chloroform and Centricon 100. The CDNAs were digested with Sal1 and Not1 enzymes and cloned into Sal1/Not1 site of pCMV-SPORT6 plasmid vector. The DH10B E. coli host was transformed with the ligation mixture by the standard chemical method. The average insert size is about 2.5 kb. The library was constructed by Yulan Piao."
                                                                                                                                                                                                                                                                                                                                                                                                                                               /note="Vector: pCMV-SPORT6 (Invitrogen); Site_1: Sal1; Site_2: Not1; Mouse cDNA project by the Laboratory of Site_2: Not1; Mouse cDNA project by the Laboratory of Genefice, National Institute on Aging (NIA), Intramural Research Program, NIH (http://lgaun.grc.nia.nih.gov/cDNA). This is a long-transcript enriched cDNA library (Ref. Genome Res. 11: 1553-1558 (2001), [PMID: 11544199]). Total RNAs were obtained from Dr. Akihiro Umezawa (Keio University School of Medicine, Japan). Double-stranded cDNAs were synthesized with an Oligo(dT) primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /clone_lib="NIA Mouse Mesenchymal Stem Cell cDNA Library
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            87.0%; Score 17.4; DB 7; Length 574; 78.9%; Pred. The present sequence represents a synthetic oligonucleotide HBV92Mb which its complementary to a portion of the hepatitis B virus (HBV) RMJ. The antisense oligonucleotide may be used to detect the presence of HBV in a sample. The antisense oligonucleotide, and oligonucleotides containing a sequence which is complementary to at least two non-contiguous regions of an HBV uncleic acid, may be used for inhibiting HBV replication in a cell or for the treatment of HBV infection
                                                                                                                                                                        Oligo:nucleotide(s) complementary to hepatitis B virus (HBV) sequences used in the detection and treatment of HBV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  a

The present sequence represents a synthetic oligonucleotide HBV-91b which contains a sequence which is complementary to at least two non-contiguous regions of a hepatitis B virus (HBV) nucleic acid. The antisense oligonucleotide may be used to detect the presence of HBV in a sample. The antisense oligonucleotide, and oligonucleotides complementary to a portion of the HBV RNA, may be used for inhibiting HBV replication in a cell or for the treatment of HBV infection
          The present sequence represents a synthetic oligonucleotide HBV-90Mb which contains a sequence which is complementary to at least two noncontiguous regions of a hepatitis B virus (HBV) nucleic acid. The antisense oligonucleotide may be used to detect the presence of HBV in a sample. The antisense oligonucleotide, and oligonucleotides complementary to a portion of the HBV RNA, may be used for inhibiting HBV replication in a cell or for the treatment of HBV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Oligo:nucleotide(s) complementary to hepatitis B virus (HBV) sequences used in the detection and treatment of HBV infection.

```
The present sequence represents a synthetic oligonucleotide HBV-91Mb which contains a sequence which is complementary to at least two noncontiguous regions of a hepatitis B virus (HBV) nucleic acid. The antisense oligonucleotide may be used to detect the presence of HBV in a sample. The antisense oligonucleotide, and oligonucleotides complementary to a portion of the HBV RNA, may be used for inhibiting HBV replication in a cell or for the treatment of HBV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Oligo:nucleotide(s) complementary to hepatitis B virus (HBV) sequences used in the detection and treatment of HBV infection.

                                                                                                                                                                                                                                                                                                                                                                                                Screening of antiviral agents by protein-priming activity of hepatitis B virus DNA polymerase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a method of screening for an antiviral agent by the protein-priming activity of hepatitis B virus (HBV) DNA polymerase. Also described is developing an antiviral agent with a high selectivity to HBV which can be used for high-throughput screening. The present sequence represents an RNA oligonucleotide which is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The invention relates to modified proteins comprising hepatitis B virus (HBV) core antigen (HBCAg) wherein one or more of the four arginine crepeats has been deleted and the protein comprising the C-terminal cysteine of HBCAg. The deleted region may be replaced by an epitope from a protein other than HBCAg, in which case the HBCAg acts as a carrier to present the epitope to the immune system. This chimeric protein or its cullic acid is useful as a vaccine or in a method of prophylactic or therapeutic vaccination of the human or animal body, particularly against the nucleic acid encoding the protein may be used in gene therapy or DNA vaccination protocols. The chimeric protein or its nucleic acid may also be used as the basis of a prophylactic vaccine against a range of diseases, e.g. HBV, hepatitis A virus (HAV), hepatitis C virus (HCV), influenza, foot-and-mouth disease, polio, herpes, rabies, acquired immunodeficiency syndrome (AIDS), dengue fever, yellow fever, malaria, tuberculosis, whooping cough, salmonellosis, typhoid, food poisoning, cucconding Hepatitis B virus core antigen (HBCAg)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New proteins comprising a modified hepatitis B core antigen, useful as a vaccine in prophylactic or therapeutic vaccination of the human or animal body, particularly against hepatitis B virus infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (HBcAg) fusion proteins and polynucleotides encoding such proteins. Sequences of the invention are useful in methods of prophylactic or therapeutic vaccination or to manufacture medicaments for prophylactic or therapeutic vaccination of the human or animal body against HBV, e.g. against wiral hepatitis. They are also useful as a prophylactic vaccine against e.g. hepatitis c vincia, influenza, polio, herpes, rabies, acquired immune deficiency syndrome (AIDS) or foot-and-mouth disease. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        present sequence is a DNA encoding hepatitis B virus core antigen (HBCAg)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to hepatitis B virus (HBV) core antigen

This invention describes a novel particle (A), comprising a protein coat with a fusion protein (FP), and, inside the coat, a nucleic acid (1) including the sequence for a virus-specific packaging signal (psi) and a structural gene. FP contains a virus protein (VP), a peptide (P) that mediates cell permeability and a heterologous cell-specific binding site (RGD). The invention also describes (1) producing (A) in which FP contains an HBV core antigen (HBCA), (P) and RGD; (3) PP; (4) DNA encoding FP; and (5) expression vector containing the DNA of (d). The products of the invention are used in gene therapy of cells and tissues, in vivo or ex vivo. This sequence encodes a (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Particle for cell-specific gene delivery, useful in gene therapy, comprises nucleic acid in protein coat that includes a fusion protein of viral protein, permeability peptide and cell-binding site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
